

TC40102BP, TC40103BP

C²MOS DIGITAL INTEGRATED CIRCUIT
SILICON MONOLITHIC

TC40102BP 8-STAGE PRESETTABLE SYNCHRONOUS DOWN COUNTER (2-Decade BCD Type)

TC40103BP 8-STAGE PRESETTABLE SYNCHRONOUS DOWN COUNTER (8-Bit Bynary Type)

The TC40102BP and TC40103BP are 8-stage presettable synchronous down counters. Output terminal $\overline{CO}/\overline{ZD}$ is placed in active mode at "L" level when the contents of count become zero.

As the TC40102BP adopts BCD binary coded decimal notation, setting up to 99 counts is possible. The TC40103BP, with 8-bit binary construction, can set up to 255 counts. Each type has $\overline{CI}/\overline{CE}$ inhibiting clock, \overline{APE} asynchronous preset control input, \overline{SPE} synchronous preset control input and \overline{RESET} control input setting counter to maximum counting mode. Clock input, with Schmitt function, can accept clock waveform with slow rise and fall edge.

PIN ASSIGNMENT

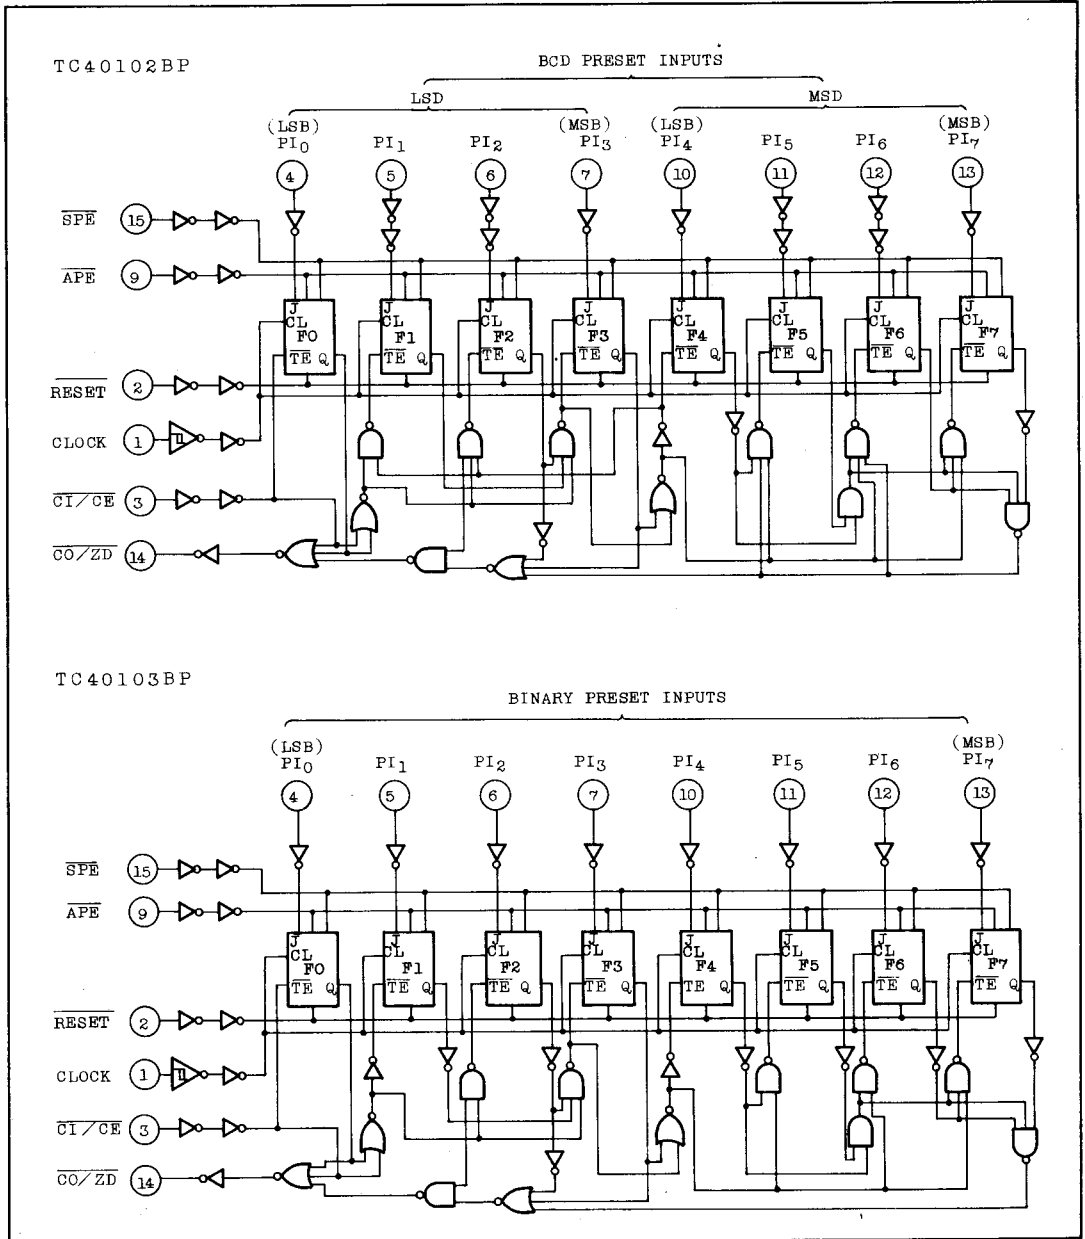

TRUTH TABLE

RESET	CONTROL INPUT			MODE	FUNCTIONAL DESCRIPTION
	APE	SPE	CI/CE		
H	H	H	H	Count inhibit	Even if clock is given, no count is made.
H	H	H	L	Regular count	Down count at rising edge of clock.
H	H	L	*	Synchronous preset	Data of PI terminal is preset at rising edge of clock.
H	L	*	*	Asynchronous preset	Data of PI terminal is asynchronously preset to clock.
L	*	*	*	Clear	Counter is set to maximum count.

Note 1. * : Don't care

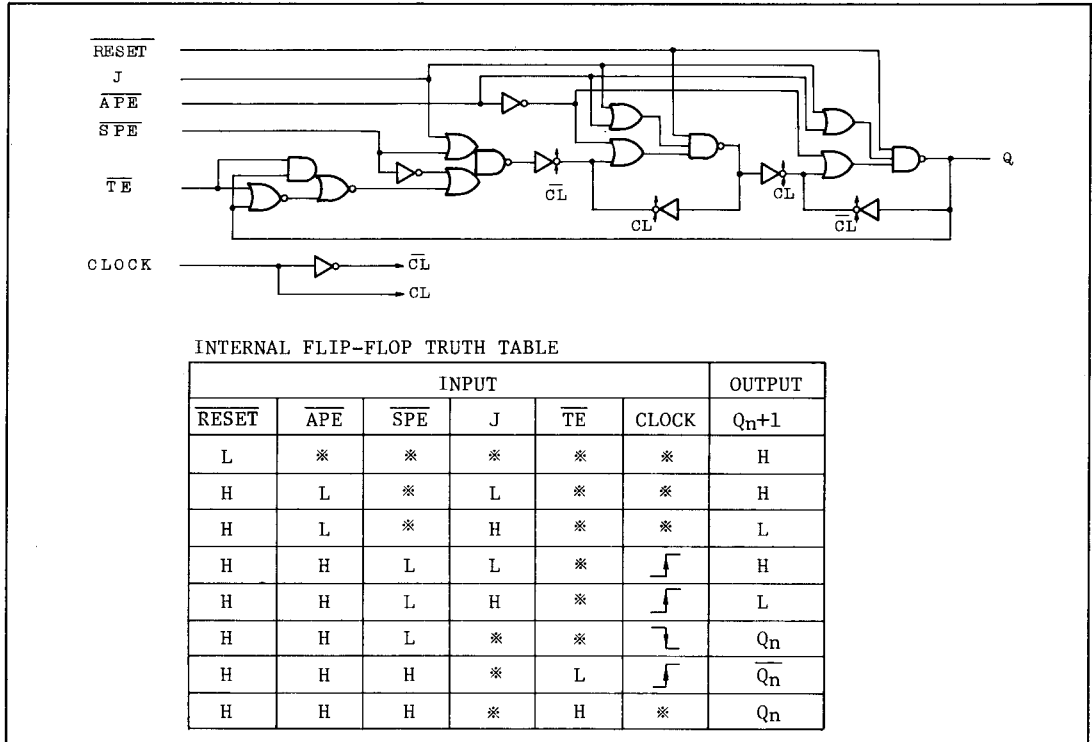

2. Maximum count: "99" for TC40102BP and "255" for TC40103BP.

LOGIC DIAGRAM

TC40102BP, TC40103BP

INTERNAL FLIP-FLOP (FO~F7) CIRCUIT DIAGRAM AND TRUTH TABLE OF COUNTER

FUNCTIONAL DESCRIPTION

The TC40102BP and TC40103BP are 8-stage presettable synchronous down counters. Carry Out/Zero Deffect ($\overline{CO/ZD}$) is output at the "L" level for the period of 1 bit when the readout becomes "0". The TC40102BP adopts binary coded decimal notation, making setting up to 99 counts possible. While the TC40103BP adopts 8-bit binary counter and can set up to 255 counts.

COUNT OPERATION

At the "H" level of control input of \overline{RESET} , \overline{SPE} and \overline{APE} , the counter carries out down count operation one by one at the rise of pulse given to **CLOCK** input. Count operation can be inhibited by setting Carry Input/Clock Enable ($\overline{CI/CE}$) to the "H" level. $\overline{CO/ZD}$ is output at the "L" level when the readout becomes "0", but is not output even if the readout becomes "0" when $\overline{CI/CE}$ is at the "H" level, thus maintaining the "H" level.

Synchronous cascade operation can be carried out by using $\overline{CI/CE}$ input and $\overline{CO/ZD}$ output.

FUNCTION DESCRIPTION (Cont'd)

The contents of count jump to maximum count (99 for the TC40102BP and 255 for the TC40103BP) if clock is given when the readout is "0". Therefore, operation of 100-frequency division and that of 256-frequency division are carried out for the TC40102BP and TC40103BP, respectively, when clock input alone is given without various kinds of preset operations. To clock input is attached Schmitt gate.

PRESET OPERATION AND RESET OPERATION

When Reset ($\overline{\text{RESET}}$) input is set to the "L" level, the readout is set to the maximum count independently of other inputs. When Asynchronous Preset Enable ($\overline{\text{APE}}$) input is set to the "L" level, readouts given on P.10 to P.17 can be preset asynchronously to counter independently of inputs other than $\overline{\text{RESET}}$ input. When Synchronous Preset Enable ($\overline{\text{SPE}}$) is set to the "L" level, the readouts given on P.10 to P.17 can be preset to counter synchronously with the rise of clock.

As to these operation modes, refer to the truth table.

WAVEFORM FOR MEASUREMENT OF DYNAMIC CHARACTERISTICS

TC40102BP, TC40103BP

APPLICATION CIRCUIT

PROGRAMMABLE DIVIDE-BY-N COUNTER

$$f_{OUT} = \frac{f_{IN}}{N+1}$$

- Timing chart when N="3"
(PI0, PI1=VDD, PI2~PI7=VSS)

- TC40102BP...1/2 to 1/100 are dividable.
- TC40103BP...1/2 to 1/256 are dividable.

PARALLEL CARRY CASCADING

* At synchronous cascade connection, buzzard occurs at CO output after its second stage when digit place changes, due to delay arrival. Therefore, take gate from TC4071BP or the like, not from CO output at the rear stage directly.

PROGRAMMABLE TIMER

Note: The above formula does not take into account the phase of clock input. Therefore, the real pulse width is the distance between the above formula-1/fIN~ the above formula.
